An highly processive, recombinant (from E.coli strain), thermostable DNA with a very high efficiency of 5'- 3' polymerase activity and 3´- 5' exonuclease (non-proofreading) activity. Xtra Taq Pol catalyzes the addition of mononucleotide units to the 3'-end of a primer chain, leading to the formation of DNA products that have 3'-overhanging A nucleotides (thus can be used in TA cloning). This enzyme remains funtional even after prolonged incubation steps at 95°C. The enzyme is supplied at 5U/µl and comes with 5X XtraWhite GL new buffer.
5X XtraWhite GL is a Genespin proprietary formulation, developed for standard and/or high-fidelity amplification of high-GC (>75%) templates. The buffer contains 7.5mM magnesium, PCR enhancers and thickening agents (vortex thoroughly prior to use) and is supplied with 1ml of 6X Orange Loading Dye GL. **5X XtraWhite GL contain an internal fluorescent stain for DNA detection on Agarose gel directly after PCR amplification.**
The Orange G dye migrates at the same rate as a duplex DNA fragment of approximately 50 Kbp and does not interfere with DNA migration when it is used as a loading dye for agarose gel electrophoresis.

FOR RESEARCH USE ONLY

UNIT DEFINITION
One unit is defined as the amount of enzyme required to incorporate 10 nanomoles of dNTPs into acid-insolubile material in 30 min at 74°C.

SHIPPING
Shipped in green ice.

STORAGE
Store at -20C°

SHELF LIFE
12 months

FORM
Liquid

CONCENTRATION
5U/ul

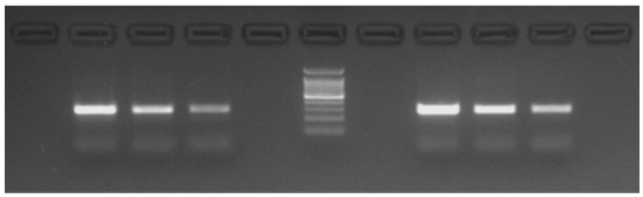
Assay Set-Up:

Before starting, vortex all components thoroughly to ensure homogeneity.
Prepare a premix for the number of assays you need according to the following protocol:

component	stock conc.	final conc.	30ul reaction
5X Buffer GL	5X	1X	6.0ul
dNTPs	10mM each.	200uM	0.6ul
Xtra Taq Polymerase	5U/ul	0.025U/ull	0.2ul
primers	1ug/ul each	50ng/ul each	2ul each
DNA Template	-	-	10-20ng
MG Water	-	-	up to 30ul



Competitor 5X XtraWhite

Comparisons of the amplification efficiency of new ***5X XtraWhite Buffer*** versus Competitor were performed using serial dilutions (1:10, 1:100, 1:1000) of Kiwi DNA and specific primers corresponding to pathogen PSA. The results are shown above. New 5X ***XtraWhite Buffer*** demonstrated excellent specificity and high efficiency in amplifying the pathogen.

Cycling conditions:

Spin down the tubes/plate briefly to remove bubbles and place them into the cycler.

denaturation	95°C	5 min	1x
denaturation	95°C	30 sec	20-35x
annealing (1)	50-68°C	30 sec	
extension (2)	72°C	30sec	

1)The annealing temperature depends on the melting temperature of the primers used.
2)The elongation time depends on the length of the fragments to be amplified. A time of 1 min/kb is recommended.

OVERVIEW

Scientist to Scientist

GeneSpin PCR green line

green line

No more post or pre-staining protocol for DNA on Agarose Gel

GeneSpin PCR geen line (Genespin proprietary formulation), is a specific PCR products line focused on **users safety.**
Either 2X PCR Mastermixes GL or 5x PCR buffers GL contain an internal fluorescent stain for DNA detetion on Agarose gel directly after PCR amplification. This particular composition is able to avoid standard protocols for post- or pre- staining DNA on Agarose Gel with Ethidium Bromide (EtBr) or different dsDNA stains. The flouorescent used in **GeneSpin PCR geen line regents** has higher sensitivity than EtBr and has an easy, fast and robust staining procedure. Detection is possible by illuminating the Agarose Gel on a UV screen. Ames test II has shown a lower mutagenic potential compared to SYBR Green I and a much lower mutagenic potential than EtBr. Storage: protect GeneSpin GL reagents from light.

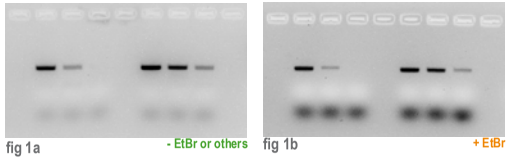

Fig. 1: Comparisons of the amplification efficiency of ***new 2X XtraRTL Master Mix GL (fig.1a) versus 2X XtraRTL Master Mix (fig.1b)*** were performed using serial dilutions (1:1, 1:10, 1:100) of rattus cDNA and specific primers corresponding to beta-actin. New ***2X XtraRTL Master Mix GL*** shows the same efficiency in amplifying the beta-actin region than ***2X XtraRTL Master Mix*** . Detection of ***2X XtraRTL Master Mix GL*** PCR product is performed without post- or pre-staining by illuminating the agarose gel (3%) on a UV screen (fig 1a).

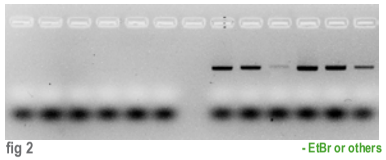

Fig. 2: Detection of ***2X XtraRTL Master Mix GL*** PCR product versus ***2X XtraRTL Master Mix*** PCR product is performed without post- or pre-staining on 3% agarose gel (fig 2) by illuminating the agarose gel on a UV screen. Only ***2X XtraRTL Master Mix GL*** PCR product is visible on the agarose gel.Both Mastermixes are visible on 3% agarose gel after pre- or post-staining with EtBr (data not shown).The amplification was performed using serial dilutions (1:1, 1:10, 1:100) of two different U2OS human cells INPUT DNA and specific primers corresponding to a centromeric region (SatCen11).

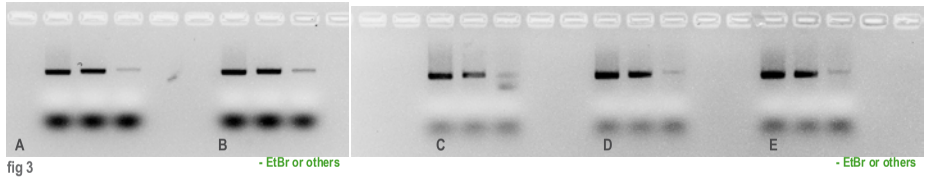

Fig. 3: Detection of ***GeneSpin PCR green line products*** on 3% agarose gel (fig 3) by illuminating the agarose gel on a UV screen without post- or pre-staining. The PCR amplification was performed using serial dilutions (1:1, 1:10, 1:100) of U2OS human cells INPUT DNA and specific primers corresponding to SON region. ***2X XtraRTL Master Mix GL (fig. 3.a), Xtra Taq (5U/ul) + 5X Xtra RTL Buffer GL (fig. 3.b), GS Taq Pol +10X PCR Buffer (fig. 3.c), 2X XtraWhite Master Mix GL (fig. 3.d), Xtra Taq (5U/ul) + 5X Xtra White Buffer GL (fig. 3.e).***

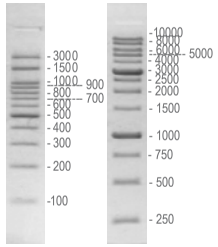

Fig. 4: ***GeneSpin 100bp GL*** (fig 4.a) ***and 1kb GL ladders*** (fig 4.b) were optimized for direct loading onto unstained agarose gels.
The ladders provide highest level of convenience during the routine handling and avoid commonly used gel staining procedures with ethidium bromide or SYBR Green I.

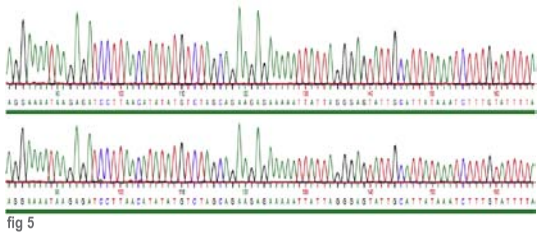

Fig. 5: Sequence analysis from PCR products of both ***2X XtraRTL Master Mix*** (up) and ***2X XtraRTL Master Mix GL*** (down).
